Goal

Demonstrate your ability to build a simple AI pet triage using LangChain, MLflow, and Python, while maintaining clean, well-documented code in GitHub.

Overview

We'd like you to create a small demo project that showcases:

1. Basic LangChain usage — building a simple LLM chain (e.g. Q&A for pet triage).
2. MLflow analysis
3. Good engineering practices - clear structure and simple ReadMe to set it up

You don't need prior experience with these tools, use documentation and examples to guide you.

Requirements

- **Language:** Python (3.10+ recommended)
- **Tools:**
 - [LangChain](#)
 - [MLflow](#)

- GitHub repo (public with read access)

Suggested Tasks

1. Use LangChain to ask an LLM to ask questions
2. Track the prompts, responses, and timing using MLflow (e.g. as parameters and metrics).
3. For the chat interface, craft it however you want. You won't be judged in any way on the quality/design UI aspects of the application. We're more interested in the internals.
4. Push your project to GitHub with:
 - README.md explaining setup and how to run it
 - requirements.txt or pyproject.toml

Resources to Get Started

LangChain:

-  Quickstart → https://python.langchain.com/docs/get_started/quickstart
-  Chains → <https://python.langchain.com/docs/concepts/chains>
-  LLMs → <https://python.langchain.com/docs/concepts/llms>

MLflow:

-  Quickstart → <https://mlflow.org/docs/latest/getting-started/index.html>
-  Logging runs → <https://mlflow.org/docs/latest/tracking.html>
-  Example code → <https://github.com/mlflow/mlflow/tree/master/examples>

Example Tutorials:

- LangChain + MLflow demo notebook → <https://github.com/mlflow/mlflow/tree/master/examples/langchain>

Deliverables

- GitHub link to your working repo (make sure it's public)
- Optional short Loom/video or short note explaining your design decisions

- Follow up interview to discuss approach and learnings
